## Explanation of Colors

Blue color is a snippet of code that you need to fully use to create a new file.

Black color in combination with green or red, means the snippet of code that was added earlier.

Green color is the snippet of code that needs to be added.

Red color is the snippet of code that needs to be removed.

## Task 01. Adding Angular Elements

1. Run the following command from the command line to add Angular Elements functionality to the project

```
>> ng add @angular/elements --project=angularElements*
```

\*May be it is not always necessary to use parameter --project

## Task 02. Adding A New Component

1. Create **SimpleComponent**. Run the following command from the command line to add Angular Elements functionality to the project

>> **ng g c simple -v Native**

2. Add Bootstrap CSS to the component. Modify the file **src/styles.css**. Use the following snippet of CSS:

```
@import '~bootstrap/dist/css/bootstrap.min.css';
```

3. Make changes to the **AppModule**. Use the following snippet of code:

```
// 1
import { AppComponent } from './app.component';

// 2
declarations: [
  AppComponent,
  SimpleComponent
],
bootstrap: [AppComponent]
```

4. Remove **AppComponent** from the project.
5. Make changes to the **index.html**. Use the following snippet of HTML:

```
<app-root></app-root>
<app-simple></app-simple>
```

## Task 03. Creating a Custom Element

1. Make changes to **AppModule**. Use the following snippet of code:

```
// 1
import { NgModule, Injector } from '@angular/core';
import { createCustomElement } from '@angular/elements';

// 2
entryComponents: [SimpleComponent]

// 3
constructor(private injector: Injector) {}

// 4
ngDoBootstrap() {
  // All this code can be placed to the constructor function, leaving this function empty.
  const el = createCustomElement(SimpleComponent, { injector: this.injector });
  // Name of custom element must include dash!
  customElements.define('app-simple', el);

  // This component exists in the global register of custom elements
  // We get function.
  console.log(customElements.get('app-simple'));
  // This component doesn't exist in the global register of custom elements.
  // We get undefined.
  console.log(customElements.get('app-root'));
}
```

## Task 04. Building for Production

1. Run the following command from the command line to build your project

```
>> ng build --prod --output-hashing none
```

## Task 05. Creating a Build Script

1. In the top-level project folder create a new file with name **elements-build.js** and insert the following code:

```
const fs = require('fs-extra');
const concat = require('concat');

(async function build() {
  const files = [
    './dist/angularElements/runtime.js',
    './dist/angularElements/polyfills.js',
    './dist/angularElements/scripts.js',
    './dist/angularElements/main.js',
  ]

  await fs.ensureDir('elements');

  await concat(files, 'elements/simple.js');

  await fs.copyFile('./dist/angularElements/styles.css', 'elements/styles.css');

  await fs.copy('./dist/angularElements/assets/', 'elements/assets/');

  // await fs.copyFile('elements/styles.css', './demo/styles.css');
  // await fs.copyFile('elements/simple.js', './demo/simple.js');

})();
```

2. Add the following line to the script section of **package.json**:

```
"scripts": {
  ...,
  "build:elements": "ng build --prod --output-hashing none && node elements-build.js"
},
```

3. Run the following command from the command line:

```
>> npm run build:elements
```

## Task 06. Using an Element

1. Create a **demo** folder outside of the project folder.
2. Move the following files:

elements/simple.js => demo/simple.js  
elements/styles.css => demo/styles.css

3. Create a **demo/index.html** file. Use the following snippet of HTML:

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Angular Elements </title>
  <link rel="stylesheet" href="styles.css">
</head>
<body>
  <app-simple></app-simple>
  <script src="simple.js"></script>
</body>
</html>
```

### Notice!

If there is an issue to run index.html, install document-register-element v1.8.1

## Task 07. Creating a Button w/ Style as Element

1. Replace the **SimpleComponent Template**. Use the following snippet of HTML:

```
<button class="btn btn-primary">  
  button works!  
</button>
```

2. Uncomment two last lines of code in **elements-build.js**

```
// await fs.copyFile('elements/styles.css', './demo/styles.css');  
// await fs.copyFile('elements/simple.js', './demo/simple.js');
```

3. Run the following command from the command line:

```
>> npm run build:elements
```

4. Open the **demo/index.html** in a browser.

## Task 08. Creating a Login Form as Element

1. Modify the **AppModule**. Use the following snippet of code:

```
imports: [BrowserModule, ReactiveFormsModule],
```

2. Replace the **SimpleComponent Class**. Use the following snippet of code:

```
import { Component, OnInit, ViewEncapsulation } from '@angular/core';
import { FormGroup, FormBuilder, Validators } from '@angular/forms';
```

```
@Component({
  selector: 'app-simple',
  templateUrl: './simple.component.html',
  styleUrls: ['./simple.component.css'],
  encapsulation: ViewEncapsulation.Native
})
export class SimpleComponent implements OnInit {
  loginForm: FormGroup;

  constructor(private fb: FormBuilder) {}

  ngOnInit() {
    this.buildLoginForm();
  }

  onLogin() {
    console.log(this.loginForm.value);
  }

  private buildLoginForm() {
    this.loginForm = this.fb.group({
      email: ['', Validators.required],
      password: ['', Validators.required],
      checkMe: false
    });
  }
}
```

3. Replace the **SimpleComponent Template**. Use the following snippet of code:

```
<button class="btn btn-primary">
  button works!
</button>
```

```
<form (ngSubmit)="onLogin()" [formGroup]="loginForm">
  <div class="form-group">
    <label for="email">Email address</label>
    <input type="email" class="form-control" id="email"
      formControlName="email"
      aria-describedby="emailHelp" placeholder="Enter email">
    <small id="emailHelp" class="form-text text-muted">We'll never share your email with anyone
else.</small>
  </div>
  <div class="form-group">
    <label for="password">Password</label>
    <input type="password" class="form-control" id="password"
      formControlName="password"
      placeholder="Password">
  </div>
</form>
```

```
</div>
<div class="form-group form-check">
  <input type="checkbox" class="form-check-input" id="checkMe"
    formControlName="checkMe">
  <label class="form-check-label" for="checkMe">Check me out</label>
</div>
<button type="submit"
  [disabled]=loginForm.invalid
  class="btn btn-primary">Submit</button>
</form>
```

4. Run the following command from the command line:

>> **npm run build:elements**

5. Open the **demo/index.html** in a browser. Fill the inputs and click submit button.

## Task 09. Using an Element Input

1. Make changes to the **SimpleComponent**. Use the following snippet of code:

```
// 1
import { Component, OnInit, ViewEncapsulation, Input } from '@angular/core';

// 2
@Input('email') emailDefaultValue = '';

// 3
private buildLoginForm() {
  this.loginForm = this.fb.group({
    email: [this.emailDefaultValue, Validators.required],
    password: ['', Validators.required],
    checkMe: false
  });
}
```

2. Run the following command from the command line:

>> **npm run build:elements**

3. Open the **demo/index.html** and make changes. Use the following snippet of HTML:

```
<app-simple email="v.zhiritskiy@gmail.com"></app-simple>
```

4. Open **demo/index.html** in a browser. The first field should have default value.

## Task 10. Using an Element Output

1. Make changes to the **SimpleComponent**. Use the following snippet of code:

```
// 1
import { Component, OnInit, ViewEncapsulation, Input, Output, EventEmitter } from '@angular/core';

// 2
@Output() sendLoginFormValue: EventEmitter<any> = new EventEmitter<any>();

// 3
onLogin() {
  console.log(this.loginForm.value);
  this.sendLoginFormValue.emit(this.loginForm.value);
}
```

2. Run the following command from the command line:

```
>> npm run build:elements
```

3. Open the **demo/index.html** and make changes. Use the following snippet of HTML:

```
<app-simple id="simple" email="v.zhiritskiy@gmail.com"></app-simple>
<script src="simple.js"></script>
<script>
  const elem = document.getElementById('simple');
  elem.addEventListener('sendLoginFormValue', function() {
    console.log(event.detail);
  });
</script>
```

4. Open the **demo/index.html** in a browser. Fill the form and click button Submit. Look to the console.

## Task 11. Using ElementRef, @HostBinding, @HostListener

1. Make changes to the **SimpleComponent**. Use the following snippet of code:

```
// 1
import { Component, OnInit, ViewEncapsulation, Input, Output, EventEmitter, ElementRef,
HostBinding, HostListener } from '@angular/core';

// 2
@HostBinding('attr.selected') isSelected = true;

// 3
constructor(private fb: FormBuilder, private el: ElementRef) {
  console.log(this.el.nativeElement);
}

// 4
@HostListener('click', ['$event'])
onHostClick(event) {
  console.log(
    'Click on Host Element. IsSelected (attr.selected): ',
    this.isSelected
  );
  console.log('Click on Host Element. $event: ', event);
}
```

2. Run the following command from the command line:

>> **npm run build:elements**

3. Open the **demo/index.html** in a browser. Open the console. Click on the element.

## Task 12. Using a Content Projection

1. Make changes to the **SimpleComponent Template**. Use the following snippet of HTML:

```
<ng-content></ng-content>  
<form (ngSubmit)="onLogin()" [formGroup]="loginForm">
```

2. Run the following command from the command line:

```
>> npm run build:elements
```

3. Open the **demo/index.html** and make changes. Use the following snippet of HTML:

```
<app-simple  
  id="simple"  
  email="v.zhiritskiy@gmail.com">  
  <h1>Login Form</h1>  
</app-simple>
```

4. Open the **demo/index.html** in a browser. You should see title “Login Form”.
